

**IN THE CLAIMS:**

The text of all pending claims, (including withdrawn claims) is set forth below. Cancelled and not entered claims are indicated with claim number and status only. The claims as listed below show added text with underlining and deleted text with ~~striketrough~~. The status of each claim is indicated with one of (original), (currently amended), (cancelled), (withdrawn), (new), (previously presented), or (not entered).

1. (ORIGINAL) A computer virus infection information providing method for detecting a computer virus in information transmitted between a terminal apparatus and a central apparatus and providing infection information concerning the detected computer virus, comprising the steps of:

- installing anti-virus software on the central apparatus;
- storing a communication history of the terminal apparatus;
- specifying the time of infection based on the stored communication history when a computer virus is detected by the installed anti-virus software;
- transmitting the infection information including the specified time of infection, from the central apparatus to the terminal apparatus; and
- displaying the transmitted infection information by using the terminal apparatus.

2. (ORIGINAL) A computer virus infection information providing system for detecting a computer virus and providing infection information concerning the detected computer virus, comprising:

- a central apparatus; and
- a terminal apparatus connected to the central apparatus via a communication network;

wherein the central apparatus includes a processor capable of performing operations of:

- installing anti-virus software;
- storing a communication history of the terminal apparatus;
- specifying the time of infection based on the stored communication history when a computer virus is detected by the installed anti-virus software; and
- transmitting the infection information including the specified time of infection, to the terminal apparatus, and wherein the terminal apparatus includes a processor capable of performing the operation of displaying the transmitted infection information.

3. (ORIGINAL) A computer virus infection information providing system according to claim 2, wherein the processor of the central apparatus is further capable of performing an

operation of registering the time of find-out which is the time when the computer virus was found out, and wherein the time of infection is specified based on the stored communication history, the registered time of find-out, and the time of installation of the anti-virus software which is the time when the anti-virus software was installed, when the computer virus is detected by the installed anti-virus software.

4. (ORIGINAL) A computer virus infection information providing system according to claim 2, wherein the processor of the central apparatus is further capable of performing an operation of specifying the route of infection of the computer virus based on the stored communication history and the time of installation which is the time when the anti-virus software was installed, and wherein the infection information including the specified route of infection and the specified time of infection is transmitted, to the terminal apparatus, when the infection information is transmitted.

5. (ORIGINAL) A computer virus infection information providing system according to claim 3, wherein the processor of the central apparatus is further capable of performing an operation of specifying the route of infection of the computer virus based on the stored communication history and the time of installation which is the time when the anti-virus software was installed, and wherein the infection information including the specified route of infection and the specified time of infection is transmitted, to the terminal apparatus, when the infection information is transmitted.

6. (ORIGINAL) A computer virus infection information providing system according to claim 3, wherein the processor of the central apparatus is further capable of performing an operation of transmitting the installed anti-virus software to a predetermined terminal apparatus, wherein the processor of the terminal apparatus is further capable of performing operations of:

installing the transmitted anti-virus software;

storing an execution history of the installed anti-virus software; and

transmitting the stored execution history to the central apparatus when a computer virus is detected by the anti-virus software, and

wherein the processor of the central apparatus is further capable of performing the operations of:

specifying the time of infection based on the transmitted execution history and the registered time of find-out;

specifying the route of infection of the computer virus based on the transmitted

execution history; and

transmitting the infection information including the specified time of infection and the specified route of infection, to the terminal apparatus.

7. (ORIGINAL) A computer virus infection information providing system according to claim 4, wherein the processor of the central apparatus is further capable of performing an operation of transmitting the installed anti-virus software to a predetermined terminal apparatus, wherein the processor of the terminal apparatus is further capable of performing operations of:

installing the transmitted anti-virus software;

storing an execution history of the installed anti-virus software; and

transmitting the stored execution history to the central apparatus when a computer virus is detected by the anti-virus software, and wherein the processor of the central apparatus is further capable of performing a operations of:

specifying the time of infection based on the transmitted execution history and the registered time of find-out;

specifying the route of infection of the computer virus based on the transmitted execution history; and

transmitting the infection information including the specified time of infection and the specified route of infection, to the terminal apparatus.

8. (ORIGINAL) A computer virus infection information providing system according to claim 2, wherein the processor of the central apparatus is further capable of performing an operation of transmitting advertising information concerning the anti-virus software to the terminal apparatus when a computer virus is detected by the anti-virus software.

9. (ORIGINAL) A computer virus infection information providing system according to claim 3, wherein the processor of the central apparatus is further capable of performing an operation of transmitting advertising information concerning the anti-virus software to the terminal apparatus when a computer virus is detected by the anti-virus software.

10. (ORIGINAL) A computer virus infection information providing system according to claim 4, wherein the processor of the central apparatus is further capable of performing an operation of transmitting advertising information concerning the anti-virus software to the terminal apparatus when a computer virus is detected by the anti-virus software.

11. (ORIGINAL) An infection information providing apparatus for detecting a computer virus in transmitted and received information and providing infection information concerning the detected computer virus, comprising a processor capable of performing operations of:

- installing anti-virus software;
- storing communication history of the information;
- specifying the time of infection based on the stored communication history when a computer virus is detected by the installed anti-virus software; and
- transmitting the infection information including the specified time of infection, to the outside.

12. (ORIGINAL) An infection information providing apparatus according to claim 11, wherein the processor is further capable of performing an operation of registering the time of find-out which is the time when the computer virus is found out, and the time of infection is specified based on the stored communication history, the registered time of find-out, and the time of installation of the anti-virus software which is the time when the anti-virus software was installed, when a computer virus is detected by the installed anti-virus software.

13. (ORIGINAL) An infection information providing apparatus according to claim 11, wherein the processor is further capable of performing an operation of specifying the route of infection of the computer virus based on the stored communication history and the time of installation which is the time when the anti-virus software was installed, and the infection information including the specified route of infection and the specified time of infection is transmitted to the outside, when the infection information is transmitted.

14. (ORIGINAL) An infection information providing apparatus according to claim 12, wherein the processor is further capable of performing an operation of specifying the route of infection of the computer virus based on the stored communication history and the time of installation which is the time when the anti-virus software was installed, and the infection information including the specified route of infection and the specified time of infection is transmitted, to the outside, when the infection information is transmitted.

15. (ORIGINAL) A computer memory product readable by a computer and storing a computer program for detecting a computer virus in transmitted and received information and providing infection information concerning the detected computer virus, the computer program

comprising the steps of:

- storing a communication history of the information; and
- specifying the time of infection based on the stored communication history when a computer virus is detected by anti-virus software.

16. (ORIGINAL) A computer virus infection information providing system for detecting a computer virus and providing infection information concerning the detected computer virus, comprising:

- a central apparatus; and
- a terminal apparatus connected to the central apparatus via a communication network;

wherein the central apparatus includes:

- means for installing anti-virus software;
- means for storing a communication history of the terminal apparatus;
- means for specifying the time of infection based on the stored communication history when a computer virus is detected by the installed anti-virus software; and
- means for transmitting the infection information including the specified time of infection to the terminal apparatus; and

wherein the terminal apparatus includes

- means for displaying the transmitted infection information.

17. (ORIGINAL) An infection information providing apparatus for detecting a computer virus in information transmitted to and received from the outside and providing infection information concerning the detected computer virus, comprising:

- means for installing anti-virus software;
- means for storing a communication history of the information;
- means for specifying the time of infection based on the stored communication history when a computer virus is detected by the installed anti-virus software; and
- means for transmitting the infection information including the specified time of infection to the outside.

18. (NEW) A computer virus infection information providing method for detecting a computer virus in information transmitted between a client and a server and providing infection information concerning the detected computer virus, comprising:

- installing anti-virus software on the server apparatus;
- detecting the virus and specifying a time of detection;
- storing a communication history of the client apparatus;

specifying a time of infection based on the time of detection and the stored communication history when the virus is detected by the installed anti-virus software;  
transmitting the infection information including the specified time of infection, from the server to the client; and  
displaying the transmitted infection information at the client.
